This utility can be used to monitor and automate the process of transferring of MySQL data to MyISAM tables. The InnoDB Table Read Ahead feature extends the durability of InnoDB tables to all transactions, not only to the ones currently in a MySQL server. This allows long queries to finish much faster with just one read from the table. While the daemon performs all necessary asynchronous operations, the Data Manipulation Language (DML) waits for all preceding nondurable I/O to complete. InnoDB and MyISAM

AConvert

If you have cyrillic text files that convert properly in Windows but you cannot read them in Linux, try a small tool called AConvert. This program simply renames the files so they become readable in both OSs. It works both sides, and supports Windows 2.8 and above. AConvert Description: If you have a problem in using AConvert, or if you want more features, there's the option to choose which version of the Cyrillic character set to use and which type of conversion to perform. NOTE: The program does not convert Latin to Cyrillic and vice versa. It simply "fixes" the cyrillic characters by adding dots to the end of the file. It can help you convert cyrillic text files from some russian language to readable on Windows (most programs cannot read them, because it is too hard), but it cannot convert English to cyrillic. Version: 3.1 (10/31/2006) License: AConvert, freeware for non-commercial use. Files: aConvert.exe AConvert.jar Size: 86 KB (379 kB compressed, 414 kB archived) Just a test to see if you're using the right Keyboard Layout. Sir, I'm using the "Russian" Keyboard Layout. On my keyboard the AltGr keys aren't reversed with the others, so I need to activate "AltGr-Shift" before I click on one of them to be able to shift correctly. I know that this is the way to go, but it can be annoving when you're used to the English keyboard layout. I mean, it's normal to access the other characters by ALT+Shift. Can you reproduce the problem while using the right Keyboard Layout? Sorry for the delay. I'm still having this problem and can't seem to find a solution. 1) Install AConvert2) Download the latest AConvert3) Run AConvert, select Convert From: Dosto, Convert To: Russian4) Quit AConvert and check the Conversion under Conversions 1) Install AConvert2) Download the latest AConvert3) Run AConvert, select Convert From: Dosto, Convert To: Russian4) Ouit AConvert5) Look at the Conversion under Conversions When I run AConvert from the Windows command line, the context menu has an option Convert From 'Dosto'. By selecting it, I'm expected to see the Conversion menu, but it isn't. I'm not sure what you are doing but when you select the Convert From:Dosto, the data will be converted from Cyrillic to Russian then to English. All the cyrillic conversion must be done first then the ru script. If this is a test, you can convert a text file and see that it's being converted correctly.
